

DCP-Max

A high analysis dicalcic phosphate

DCP-Max has twice the P content of standard dicalcic phosphate so cartage and spreading costs are reduced.

Key Benefits

Application costs less

With a higher P content, less DCP-Max is needed to get the same results as other phosphate products, so application costs are reduced. It's also seed safe, allowing seed and fertiliser to be applied at the same time.

Environmental impacts are reduced

Being a dicalcic phosphate, DCP-Max is less soluble than superphosphate and releases its nutrients more slowly as pasture and crops grow. Environmental losses are therefore reduced.

Application is safe

DCP-Max is well granulated which means there is minimal dust, it's more accurate to spread, and it's safe for aerial application.

Usage

DCP-Max is perfect for aerial spreading on hill country, but it's also well suited to broadcasting in any agricultural situation and blends well with other products like nitrogen and trace elements.

Availability

Available from Fertco's Te Awamutu and Mount Maunganui stores.
