

N-durance

Nitrogen that goes the distance

N-durance is a blend of both slow and controlled release nitrogen which provide a more consistent supply of nitrogen over a longer time. You need less nutrient to achieve the same growth.

Key Benefits

Get both slow and controlled nutrient release

N-durance is nutrient-efficient because it's a blend of both N-inhibited urea and polymer-coated urea (PCU). N-inhibition slows down the conversion of urea into plant-available nitrogen while the granules of PCU control the release of nitrogen through their coating.

Reduce wastage and loss

Nutrients that are released slowly and in a controlled way are less likely to leach into waterways. N-durance makes it easier to comply with the nitrogen cap without compromising growth.

Save time and money

Because the nutrients in N-durance stay around longer, repeat applications of nitrogen are not needed. That's time and money saved.

Application

Apply at 50 - 100 kg/ha

Storage

Store in a cool, dry, well-ventilated place out of direct sunlight.
