

# RePlenish

## A dicalcic Fertiliser

*RePlenish is a dicalcic fertiliser, helping to maintain the pH of the soil because it is less acidic around phosphate granules when in contact with moist soil.*

### Key Benefits

#### **Maintaining soil pH**

RePlenish is a dicalcic fertiliser, helping to maintain the pH of the soil because it is less acidic around phosphate granules when in contact with moist soil. It has the same phosphate content as super phosphate but is less water soluble reducing the total phosphate loading. Its granular form makes for easy spreading. RePlenish is Fertmark registered.

#### **Usage**

RePlenish is well granulated and can be broadcast by ground spread equipment or from aircraft with minimal risk of P loss so can be applied early with confidence.

#### **Storage**

Store in a cool, dry, well-ventilated place out of direct sunlight.
